1 Introduction

1.1 Optimization problem

$$\min_{w \in \mathbb{R}^p} f(w) = L(w) + \lambda \Omega(w)$$

$$\min \sum_{i=1}^{N} \log(1 + \exp(-y^{(i)}w^{T}x^{(i)})) + \lambda ||w||^{2}$$
(1)

where i = ..., N are the dataset indices, $y^i \in \{-1, 1\}$ is the response variable corresponding to the negative or positive class, $x^i \in \mathbb{R}^p$ are dataset examples.

$$\nabla f(w) = X^T r + 2\lambda w, \quad r = -y^{(i)} \sigma(-y^{(i)} w^T x^{(i)})$$

$$\nabla^2 f(w) = X^T D X + 2\lambda I, \quad d_{ii} = \sigma(y^{(i)} w^T x^{(i)}) \sigma(-y^{(i)} w^T x^{(i)})$$

Proposition 1. Problem (1) admits a unique optimal solution.

$$X^{T} = \begin{pmatrix} 1 & x_{1}^{(1)} & x_{2}^{(1)} & \dots & x_{p}^{(1)} \\ 1 & x_{1}^{(2)} & x_{2}^{(2)} & \dots & x_{p}^{(2)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & x_{1}^{(N)} & x_{2}^{(N)} & \dots & x_{p}^{(N)} \end{pmatrix} \in \mathbb{R}^{N \times (p+1)}$$

$$w = \begin{pmatrix} b \\ w_1 \\ w_2 \\ \vdots \\ w_p \end{pmatrix} \in \mathbb{R}^{p+1}$$

$$y = \begin{pmatrix} y^{(1)} \\ y^{(2)} \\ \vdots \\ y^{(N)} \end{pmatrix} \in \{-1, 1\}$$

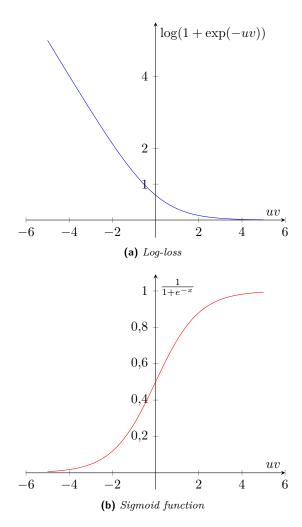

Figure 1: Log-loss and sigmoid function plots $\,$

- $uv \gg 0$: the example is labelled correctly
- $uv \ll 0$: the class assigned to the example is the wrong one
- the hessian matrix is positive defined $\forall w$, this means that the objective function, which is quadratic, is coercive and for the continuity that function admits global minimum, so f(w) has finite inferior limit
- the hessian matrix being positive defined implies also that the objective function is strictly convex (on the other hand the loss function is just convex, due to its hessian matrix being positive semi-defined), this implies that if the global minimum exists, that solution is unique
- a global minimum is a point that satisfy $\nabla f(w^*) = 0$, which is a sufficient condition implied by the convexity of the problem, see figure 1a on the preceding page
- the ℓ_2 regularization implies that the objective function is strongly convex, this speeds up the convergence
- further more we can assume that $\nabla f(w)$ is Lipschitz-continuous with constant L

2 Mini-batch gradient descent variants

2.1 Fixed step-size

Mini-batch Gradient Descent with fixed or decreasing step-size

```
given w^0 \in \mathbb{R}^n, f(w) = \sum_{i=1}^N f_i(w), k=0 e \{\alpha_k\} \mid \alpha_k = \alpha \vee \alpha_k = \frac{\alpha_0}{k+1} while (\|\nabla f(w^k)\| > \varepsilon(1+|f(w)|)) shuffle \{1,\ldots,N\} and split B_1,\ldots,B_{N/M} such that 1<|B_t|=M\ll N set y_0=w^k for t=1,\ldots,N/M get mini-batch indices from B_t approximate true gradient \nabla f_{i_t}(w) = \frac{1}{M} \sum_{j\in B_t} \nabla f_j(y_{t-1}) compute direction d_t = -\nabla f_{i_t}(y_{t-1}) make a (internal) step y_t = y_{t-1} + \alpha_t d_t end for update weights w^{k+1} = y_{N/M} epoch ends k=k+1
```

2.2 Stochastic line search

Mini-batch Gradient Descent with Armijo line search

```
1 given w^0\in\mathbb{R}^{p+1}, f(w)=\sum_{i=1}^N f_i(w), \gamma\in(0,1),\,\delta\in(0,1),\,\alpha_0\in\mathbb{R}^+
3 while (\|\nabla f(w^k)\| > \varepsilon(1+|f(w)|))
4 shuffle \{1,\dots,N\} and split B_1,\dots,B_{N/M} such that 1<|B_t|=M\ll N
set y_0 = w^k
6 for t = 1, ..., N/M
     get mini-batch indices i_t from B_t
     approximate true gradient 
abla f_{i_t}(w) = rac{1}{M} \sum_{j \in B_t} 
abla f_j(y_{t-1})
   compute direction d_t = -\nabla f_{i_t}(y_{t-1})
   \alpha = \mathtt{reset}(), q = 0
   compute potential next step y_t = y_{t-1} + \alpha d_t
   while (f_{i_t}(y_t) > f_{i_t}(y_{t-1}) + \gamma \alpha \nabla f_{i_t}(y_{t-1})^T d_t)
     reduce step-size lpha=\deltalpha
     rejections counter q=q+1
   end while
   set optimal mini-batch step-size lpha_t=lpha
   make a (internal) step y_t = y_{t-1} + lpha_t d_t
17
18 end for
update weights w^{k+1} = y_{N/M}
_{20}\quad {\tt epoch\ ends}\ k=k+1
21 end while
```

2.3 Fixed momentum term

Mini-batch Gradient Descent with fixed Momentum term and fixed step-size

```
given w^0 \in \mathbb{R}^{p+1}, f(w) = \sum_{i=1}^N f_i(w), \{\alpha_k\} = \alpha, \beta \in (0,1) k=0 while (\|\nabla f(w^k)\| > \varepsilon(1+|f(w)|)) shuffle \{1,\dots,N\} and split B_1,\dots,B_{N/M} such that 1<|B_t|=M\ll N set y_0=w^k, d_0=0 for t=1,\dots,N/M get mini-batch indices i_t from B_t approximate true gradient \nabla f_{i_t}(w) = \frac{1}{M} \sum_{j \in B_t} \nabla f_j(y_{t-1}) compute direction d_t = -\left((1-\beta)\nabla f_{i_t}(y_{t-1}) + \beta d_{t-1}\right) make a (internal) step y_t=y_{t-1}+\alpha_t d_t end for update weights w^{k+1}=y_{N/M} epoch ends k=k+1
```

Mini-batch Gradient Descent with Armijo line search for Momentum term and step-size

```
\text{1 given } w^0 \in \mathbb{R}^{p+1} \text{, } f(w) = \sum_{i=1}^N f_i(w) \text{, } \gamma \in (0,1), \, \delta_a \in (0,1), \, \alpha_0 \in \mathbb{R}^+ \text{, } \delta_m \in (0,1), \, \beta_0 \in (0,1)
3 while (\|\nabla f(w^k)\| > \varepsilon(1+|f(w)|))
    shuffle \{1,\ldots,N\} and split B_1,\ldots,B_{N/M} such that 1<|B_t|=M\ll N
     set y_0 = w^k, d_0 = 0
     for t=1,\ldots,N/M
       get mini-batch indices i_t from B_t
      approximate true gradient \nabla f_{i_t}(w) = \frac{1}{M} \sum_{j \in B_t} \nabla f_j(y_{t-1}) compute potential next direction d_t = -\left((1-\beta)\nabla f_{i_t}(y_{t-1}) + \beta d_{t-1}\right)
10
       while (\nabla f_{i_t}(y_{t-1})^T d_t \geq 0)
11
        reduce momentum term \beta = \delta_m \beta, \, \delta_m = 1/2
12
        rejections counter q_m = q_m + 1
13
       end while
      set optimal mini-batch momentum term eta_t = eta
      \alpha = \mathtt{reset}(), q_a = 0
      compute potential next step y_t = y_{t-1} + \alpha d_{t-1}
      while (f_{i_t}(y_t) > f_{i_t}(y_{t-1}) + \gamma \alpha \nabla f_{i_t}(y_{t-1})^T d_t)
       reduce step-size lpha=\delta_alpha
19
       rejections counter q_a=q_a+1
20
      end while
21
      set optimal mini-batch step-size \alpha_t = \alpha
22
      make a (internal) step y_t = y_{t-1} + \alpha_t d_t
23
_{24} end for
25 update weights w^{k+1} = y_{N/M}
_{26} epoch ends k=k+1
27 end while
```
